

COLLEGE OF COMPUTER AND INFORMATION SCIENCE

---

**Academic Year 2025 – 2026**

**CS199F (CS PRACTICUM) NARRATIVE REPORT**

Submitted by:  
Michaela VILLAMANTE

Submitted to:  
Jonalyn G. Ebron

Submitted to the Faculty of Mapúa Malayan Colleges Laguna  
In Partial Fulfillment of the Requirements for the degree of

Bachelor of Science in Computer Science

## **Overview of the Practicum Engagement**

### **Company Background**

The student completed the internship at Osaka Gas Information System (OGIS) Philippines Inc., a Philippine-based digital transformation and IT consulting company that helps organizations improve their business operations through enterprise technologies, cloud solutions, business intelligence, and professional training. The company specializes in delivering end-to-end digital solutions that enable businesses to streamline processes, improve decision-making, and accelerate growth. Backed by over two decades of expertise and a team of more than 200 technology professionals, OGIS Philippines serves organizations across multiple industries by implementing enterprise software, data analytics, cloud-based solutions, and IT consulting services. It is part of the OGIS Group, which traces its roots to OGIS-RI (Osaka Gas Information System Research Institute) in Japan, allowing the company to combine global expertise with localized solutions for Philippine businesses.

OGIS Philippines is committed to helping organizations achieve sustainable growth through innovation and digital transformation. The company provides a comprehensive range of services, including Enterprise Resource Planning (ERP) implementation, Customer Relationship Management (CRM) solutions, Business Intelligence and Data Analytics, Cloud Infrastructure and Migration, IT Operations and Infrastructure Management, Managed IT Services, Business Process Consulting, Workforce and Payroll Management, Sales and Marketing Automation, and corporate training programs. Through these services, OGIS Philippines enables businesses to enhance operational efficiency, optimize business processes, and make informed, data-driven decisions.

The internship was conducted under the Consultant Online Development and Excellence (CODEX) Program, a free industry training initiative developed by FIT Academy in partnership with OGIS Philippines and other industry organizations. The CODEX Program is designed to prepare undergraduate students, fresh graduates, and young professionals for careers in Enterprise Resource Planning (ERP), Business Intelligence, and IT consulting. The program combines structured technical training, professional development, product-specific learning, and real-world project experience to equip participants with the knowledge and practical skills required in the technology industry. Through the program, interns gain exposure to industry-standard tools and best practices while working alongside experienced consultants in a professional environment.

### **Nature of Assignments or Tasks Given**

During the internship, the student was assigned to the Business Analytics track. The internship was conducted through the Consultant Online Development and Excellence (CODEX) Program which consisted of three phases: Phase 1 - General IT and Soft Skills Training, Phase 2 - Product Specific Training, and Phase 3 - Case Study/Work Immersion.

During Phase 1 and 2, the student underwent a series of technical and professional development lectures, hands-on activities, and examinations designed to prepare interns for real-world consulting work. The training covered fundamental concepts in information technology, business processes, and enterprise solutions, while also enhancing communication, teamwork, critical thinking, and problem-solving skills.

Upon successful completion of the training program, the student proceeded to Phase 3, where they were assigned to the Fasttrack Data Solutions (FDS) department of OGIS Philippines. The primary responsibility was to assist in the development, enhancement, and maintenance of interactive dashboards and reports using Microsoft Power BI. The internship

provided hands-on experience in transforming raw business data into meaningful visualizations that support data-driven decision-making for clients and internal stakeholders.

The student participated in various stages of the business analytics development process, beginning with data preparation and validation. This involved importing datasets from multiple data sources, reviewing data quality, identifying inconsistencies, removing duplicate records, and ensuring that the information reflected the most recent and accurate data before visualizations. Data transformation and cleansing were performed using Power Query Editor to prepare datasets for analysis.

A significant portion of the internship involved designing and developing Power BI dashboards. The student created interactive reports that incorporated various visual elements such as KPI cards, matrices, bar charts, and slicers to present business information clearly and effectively. Report layouts were organized to improve usability and provide stakeholders with intuitive access to key performance indicators and operational metrics.

The student also developed Data Analysis Expressions (DAX) measures and calculated fields to support dashboard functionality. These measures were used to compute business metrics, display dynamic values, and calculate reporting periods. The implementation of DAX enabled the dashboard to provide accurate and responsive analytical insights.

Another key responsibility was validating dashboard outputs by comparing report visuals with their corresponding source tables. This process ensured the consistency and accuracy of displayed information, verified that the latest uploaded data matched the source records, and confirmed that calculated values and business metrics were correctly presented.

Throughout the internship, the student collaborated closely with consultants and supervisors during progress reviews and task discussions. Constructive feedback was incorporated into report revisions, enabling continuous improvement of both technical and

analytical skills while ensuring that project deliverables met organizational standards and client requirements.

### **Total Hours Rendered**

The internship commenced on April 27, 2026, and concluded on July 29, 2026, through the Consultant Online Development and Excellence (CODEX) Program, which consisted of three phases: Phase 1 – General IT and Soft Skills Training, Phase 2 – Product-Specific Training, and Phase 3 – Case Study/Work Immersion. Throughout the program, the student successfully completed all required training activities, assessments, and internship assignments, rendering a total of 480 internship hours.

The first phase focused on developing foundational knowledge programming, database querying, accounting, the fundamentals of Enterprise Resource Planning (ERP), and the use of business software applications such as Microsoft Excel and Microsoft Visio. The student also learned about how to communicate effectively in the workplace and the essential competencies to become a successful consultant. A total of 48 hours were rendered during Phase 1.

The second phase focused on advanced topics in data science and analytics, data visualization, and data warehousing. During this phase, the student received hands-on training in Microsoft Power BI, including dashboard development, data modeling, and report creation. The training also introduced enterprise technologies such as SAP and the Cloudera Data Platform, providing the student with practical exposure to industry-standard tools used in business intelligence and data management. A total of 62 hours were completed during Phase 2.

Following the successful completion of the training phases, the student proceeded to Phase 3 - Case Study/Work Immersion, where 370 hours were rendered. During this phase, the student actively participated primarily in development, enhancement, and validation of

dashboard and reports, while collaborating with consultants and applying the knowledge and skills acquired during the training phases.

The distribution of internship hours is presented in Table 1.

Table 1. *CODEX Program Hours Distribution*

| <b>CODEX Phase</b> | <b>Description</b>                  | <b>Hours Rendered</b> |
|--------------------|-------------------------------------|-----------------------|
| Phase 1            | General IT and Soft Skills Training | 48 hours              |
| Phase 2            | Product-Specific Training           | 62 hours              |
| Phase 3            | Case Study / Work Immersion         | 370 hours             |
| <b>Total</b>       |                                     | <b>480 hours</b>      |

## Presentation of Output

### Hands-on Dashboard Exercise

During the Product-Specific Training phase of the CODEX Program, the student completed a hands-on exercise that involved designing and developing an interactive dashboard using a provided dataset in Microsoft Power BI. The exercise allowed the student to freely determine the dashboard layout, visualizations, and analytical approach while applying data visualization principles learned during the training.

Figure 1. Invoice Report Dashboard

The Invoice Report Dashboard shown in Figure 1 was developed to provide a comprehensive overview of invoice transactions by summarizing paid and unpaid amounts through interactive visualizations. The dashboard features KPI cards displaying the total paid and unpaid invoice amounts, charts illustrating invoice status and yearly trends, and visualizations identifying the top customers and account managers based on invoice value. Interactive slicers allow users to filter the report by year and account manager, while DAX measures were implemented to calculate dynamic metrics and update visualizations based on

user selections. This dashboard enables users to efficiently monitor invoice performance and identify trends that support financial reporting.

Figure 2. Aging Report Dashboard

The Aging Report Dashboard shown in Figure 2 was designed to monitor outstanding receivables by categorizing balances according to their aging periods. The dashboard presents KPI cards for current balances and overdue amounts across different aging brackets, including 0–18 days, 31–60 days, 61–90 days, 91–120 days, and over 120 days. It also includes a bar chart highlighting customers with the highest outstanding receivables and a detailed matrix summarizing aging balances per customer. DAX calculations were utilized to compute aging categories and aggregate balances dynamically.

Figure 3. Customer Payment Dashboard

The Customer Payment Dashboard shown in Figure 3 was created to analyze customer payment behavior by classifying transactions into payment statuses such as Advanced, On-Time, Late, and Delinquent. KPI cards summarize the total payment amounts for each category, while trend charts illustrate payment patterns over time. A bar chart highlights the top-paying customers, enabling users to identify major contributors to revenue. Interactive filters allow users to analyze payment information by year and payment status. DAX measures were developed to generate dynamic calculations in payment status and ensure that all visualizations respond accurately to user interactions.

## Case Study

During the Case Study phase of the CODEX Program, the student was tasked with analyzing a business problem scenario using the provided AdventureWorks dataset and developing an interactive dashboard in Microsoft Power BI. Based on the given business scenario, the objective was to address the challenges of managing multiple Excel files and

provide a centralized reporting platform that would enable the sales team and management to efficiently monitor business performance.

To accomplish the case study requirements, the student developed a reporting solution consisting of five report pages: Main Dashboard, Sales by Territory, Sales by Reseller, Sales by Product, and Sales by Customer. The solution consolidated sales information into a single interactive report, allowing users to analyze data from different perspectives while eliminating the need to manually review multiple Excel files.

*Figure 4. Entity Relationship Diagram (ERD)*

Figure 4 illustrates the data model used in developing the AdventureWorks Power BI dashboard. The model follows a star schema, where the Sales table serves as the central fact table containing transactional sales records. It is connected to several dimension tables, including Product, Customer, Reseller, Sales Territory, Sales Order, and Date, through one-to-many relationships.

Figure 5. AdventureWorks Main Dashboard

Figure 5 presents the main dashboard of the AdventureWorks Sales Report. This dashboard serves as the central overview of the company's sales performance by displaying key performance indicators (KPIs), including Total Sales Amount, Gross Profit, Total Customers, Total Products, and Total Orders. Interactive slicers for Fiscal Year, Region, Business Type, Channel, and Category enable users to filter the displayed information according to their analytical needs. The dashboard also includes visualizations showing monthly sales trends, regional sales distribution, the top five products by sales, and the top five resellers by sales. Navigation buttons are provided at the top of the dashboard, allowing users to access more detailed reports for Sales by Territory, Sales by Reseller, Sales by Product, and Sales by Customer.

*Figure 6. Sales by Territory Report*

Figure 6 presents the Sales by Territory report, which provides a detailed analysis of sales performance across different territories. Users can filter the report using Fiscal Year, Region, Business Type, Channel, and Category. The report highlights the top-performing territory, total number of territories, total sales, and total order quantity through KPI cards. A bar chart compares sales across regions, while a map visualization displays the geographical distribution of sales. A detailed table further summarizes sales by region, country, and territory group, allowing users to identify high-performing geographic locations and evaluate regional sales performance.

Figure 7. Sales by Reseller Report

Figure 7 illustrates the Sales by Reseller report, which focuses on reseller performance. The report allows users to filter data by Business Type, Channel, and Category. It displays KPIs for the top reseller, total number of resellers, total sales, and average sales per reseller. Supporting visualizations include a bar chart showing the highest-performing resellers and pie chart comparing sales across different business types. A detailed table lists reseller information, including business type, city, country, and sales amount, enabling users to evaluate reseller contributions and identify top-performing partners.

Figure 8. Sales by Product Report

Figure 8 shows the Sales by Product report, which provides insights into product performance and profitability. Users can filter the data by Business Type, Channel, Category, Color, and Price Adjustment. The dashboard displays KPIs for Total Sales Amount, Total Product Cost, Gross Profit, and Profit Margin. Additional visualizations summarize sales by product category and display adjusted list prices for products. A detailed product table presents information such as product name, SKU, category, standard cost, list price, adjusted price, and sales performance. This report enables users to analyze product profitability and assess the impact of pricing adjustments.

Figure 9. Sales by Customer Report

Figure 9 presents the Sales by Customer report, which analyzes customer purchasing behavior. Users can filter the report by Business Type, Channel, Category, Country-Region, and State-Province. KPI cards display the top customers, total number of customers, total sales, and average sales per customer. A bar chart ranks the highest-spending customers, while a geographic map illustrates customer distribution based on sales locations. A detailed customer table provides customer names, cities, country or region, and total sales amount, allowing users to identify valuable customers and understand customer distribution across different locations.

### Quality Scorecard Mobile View

During the work immersion phase, the students' first task was to develop the mobile view of the Logistics Department Quality Scorecard of the client through Microsoft Power BI. The report was designed to provide stakeholders with convenient access to key performance indicators (KPI) through mobile devices.

Figure 10. Logistics Department Quality Scorecard

As seen in Figure 10, the mobile dashboard features interactive slicers for fiscal year, month, week, supervisor, shift, and location, enabling users to filter data based on specific operational requirements. It also includes KPI cards, trends visualizations, and navigation buttons that allow users to switch between different logistics metrics and reporting pages. The

student ensured that the mobile report-maintained consistency with the desktop version while improving usability, accessibility, and overall user experience.

### **Latest Uploaded Data Tracker**

During the work immersion phase, the student designed a dashboard to serve as a centralized reporting tool that enables stakeholders to monitor manufacturing metrics and efficiently access supporting information from different data sources. It consists of four report categories: Primary, Secondary, Annual Operating Plan (AOP), and Calculation each serving a specific reporting purpose.

As part of the development process, the student created DAX measures to dynamically retrieve and display the latest uploaded date and latest value for each metric and implement bookmarks and navigation features to improve report usability. To further enhance data monitoring, conditional formatting was applied to the latest upload date. Dates corresponding to the current reporting month were displayed in green, indicating that the dataset was up to date, while dates from previous months were displayed red, signaling that the dataset had not been updated for the current reporting period. This dashboard helped streamline the data validation process by providing stakeholders with a centralized view of dataset update statuses, reducing the time required to manually verify the recency of data across multiple files.

Figure 11. Primary and Secondary Metrics Latest Uploaded Dashboard

The dashboard organizes the primary and secondary metrics into categories such as Manufacturing Sustainability, Customer Service Level, Pine Metrics, Papaya Metrics, Direct Labor, Utilities, Profit Leaks, Quality Metrics, and Maintenance Metrics. For each selected metric, the dashboard displays relevant information including the metric name, filename, SharePoint link, sheet name, and latest upload date. This allows users to easily determine the origin of the data and confirm that reports are based on the most recent dataset available.

*Figure 12. Annual Operating Plan Metrics Dashboard*

The dashboard shown in Figure 12 was designed to monitor the actual performance values of manufacturing metrics based on different reporting periods. It displays the Fiscal-to-Date (FTD), Week-to-Date (WTD), Month-to-Date (MTD), and Year-to-Date (YTD) values for each manufacturing metric, allowing stakeholders to evaluate operational performance against the organization’s annual operating plan. It also provides supporting information such as the corresponding filename, SharePoint link, and sheet name for each metric to facilitate data verification and traceability.

*Figure 13. Calculation of Metrics Dashboard*

The dashboard shown in Figure 13 displays the computation of each metric. It provides a clear explanation of the calculation logic for Fiscal-to-Date (FTD), Week-to-Date (WTD), Month-to-Date (MTD), and Year-to-Date (YTD), making it easier for users to understand how each metric is derived without requiring technical knowledge of DAX.

## **Synthesis of the Practicum Engagement**

### **Learnings**

The practicum provided the student with the opportunity to experience the complete process of developing business analytics solutions using Microsoft Power BI. The experience began with gathering data from different sources, followed by data cleaning and preprocessing using Power Query to ensure that the datasets were accurate, consistent, and ready for analysis. The student also learned how to design dashboards by selecting appropriate visualizations that effectively communicate business information, create DAX measures to display data dynamically, and use bookmarks and page navigators to improve report navigation and user experience. Furthermore, the student gained experience in publishing reports through Power BI Service and validating the data displayed to ensure that the dashboards accurately reflected the source data and met the client's requirements.

Beyond the technical skills acquired, the practicum enabled the student to understand the purpose and value of business analytics in supporting organizational decision-making. The student realized that developing a dashboard involves more than creating visually appealing reports; it requires careful planning, accurate data preparation, thorough validation, and continuous attention to detail throughout the development process. Through this experience, the student learned that dashboards serve as effective tools for transforming business data into meaningful insights, allowing organizations to monitor performance, identify trends, and support informed day-to-day business decisions.

### **Realization**

Throughout the practicum, the student realized that the role of a business analyst extends far beyond designing dashboards. Although technical skills are essential, successful project implementation also depends on effective communication, collaboration, adaptability,

and professionalism. One of the most significant realizations was being able to communicate ideas effectively and present your output in a clear and story-like manner so that clients and stakeholders can easily understand the insights being communicated.

Another important realization was the value of adaptability and continuous learning. Technology continues to evolve rapidly, and organizations constantly adopt new tools and processes to improve their operations. Being willing to learn new software, participate in training programs, and earn certifications can provide opportunities for continuous growth and career advancement.

The student also realized that attention to detail is critical when working with business data. A dashboard that contains inaccurate calculations or incorrect information may lead to poor business decisions. Because of this, validating reports, checking calculations, and reviewing outputs became important habits throughout the practicum.

In addition, the practicum emphasized the importance of time management and teamwork. Meeting project deadlines, completing assigned tasks on schedule, and respecting the working hours of colleagues contribute to a productive work environment. Overall, the practicum demonstrated that becoming an effective business analyst requires a balance between technical expertise and interpersonal skills.

## **Conclusion**

As an intern, the company helped the student to be exposed to how business solutions operate in the real-world setting. The experience provided a deeper understanding of how organizations use data to support decision-making and improve operational efficiency. The practicum also enabled the student to appreciate the importance of producing accurate, reliable, and meaningful reports that address business needs. Beyond creating visually appealing

dashboards, the student understood the responsibility of ensuring that business information is presented clearly and accurately so that stakeholders can make informed decisions.

The internship also strengthened the student's confidence in applying the knowledge and skills acquired throughout the academic program in a professional environment. By working on actual business projects and collaborating with experienced professionals, the student gained practical insights into workplace expectations and the importance of continuous learning. These experiences reinforced the value of combining technical expertise with professionalism, responsibility, and effective collaboration in achieving project goals.

Overall, the internship was a meaningful and rewarding learning experience that contributed significantly to the student's academic, technical, and professional growth. The company provided an environment where the student could develop practical skills, gain industry exposure, and understand real-world business processes. The student aspires to apply the knowledge, experience, and values gained throughout the practicum to contribute positively to the business and information technology industry while continuing to learn and grow as a future professional.

## Appendices

### Appendix A

#### Competency-Based CV

## MICHAELLA VILLAMANTE

villamantemichaella5@gmail.com | 0947 625 8016 | Calamba City, Laguna |  
<https://github.com/mvillamante>

#### PROJECTS

##### Geospatial Data Analytics System (*React, Django*)

Developed a web-based system for assessing hazard and environmental risks using multi-source geospatial data

##### Electronic Health Record (EHR) System (*React, Node.js*)

Developed an EHR system for a children's therapy center, enabling patient data management, appointment scheduling, and therapist access to medical records

##### Student Clustering System (*Python, WEKA, HTML*)

Developed a machine learning model to classify students based on study styles using clustering algorithms

##### Online Cinema Ticketing System (*ASP.NET, C#*)

Designed and developed a web-based ticket booking system with movie selection, scheduling, and ticket management functionality

#### ACHIEVEMENTS & ACTIVITIES

##### Computer Science Representative - Student Council

Represented Computer Science students in academic and student affairs and assisted in organizing academic and student engagement activities

##### Member - Junior Philippine Computer Society (JPCS)

Actively engaged in technology-related seminars, workshops, and events

##### Member - Junior Association for Computing Machinery (Junior ACM)

Participated in programming-related activities and technology focused events

##### Project Leader - Thesis Project

Led a team in developing a geospatial data analytics system and coordinated task distribution and deadlines

#### EDUCATION

##### Mapúa Malayan Colleges Laguna

2022 - Present

*Bachelor of Science in Computer Science Specializing in Data Science and Analytics*

Relevant Coursework: Data Structures and Algorithms, Object-Oriented Programming, Introduction to Machine Learning, Fundamentals of Data Science, Analytics Techniques and Tools

##### Senior High School - ICT Strand

2020 - 2022

Relevant Coursework: Computer Programming (Java, Flowchart, Pseudocode), Statistics and Probability, Animation (Adobe Illustrator, Photoshop)

#### TECHNICAL SKILLS

**Programming:** Python, Java, C#, C++, Assembly

**Web Development:** HTML, CSS, JavaScript

**Frameworks & Technologies:** Node.js, Django

**Design & Tools:** Git, VS Code, Figma, Microsoft Office

## Appendix B

### Endorsement Letter

24 April 2026

**MS. MERRY ANN TROSA**  
Internship Coordinator  
OGIS Philippines, Inc.  
5F, Insular Life Building, Ayala Ave  
Makati City, 1226 Metro Manila

Dear Ms. Trosa,

The BS Computer Science program of Mapúa Malayan Colleges Laguna requires its students to undergo a Practicum program for a minimum of 480 hours during the third term of our academic calendar.

We would like to request that Ms. Michaela Villamante be permitted to undergo training at your company. We believe your company can provide the exposure our students need to achieve the intended learning outcomes of the BS Computer Science program. We are confident that she will acquire the practical knowledge and skills expected of a Computer Science graduate, thereby ensuring a continuous supply of CS professionals for your company.

We thank you for your favorable action and look forward to a more meaningful partnership that is mutually beneficial to our students and your company.

With warm regards,

  
**JONALYN G. EBON**  
BS Computer Science Program Chair  
College of Computer and Information Science

### Liability Waiver

REVISION NO.: 00  
REVISION DATE: May 10, 2018

#### STUDENT TRAINING AGREEMENT AND LIABILITY WAIVER

##### IMPORTANT INFORMATION

- THIS FORM IS TO BE ACCOMPLISHED AND SUBMITTED BY STUDENT TRAINEE TO THE PRACTICUM ADVISER BEFORE STARTING THE PRACTICUM.
- READ AND UNDERSTAND THE PROVISIONS OF THIS AGREEMENT AND WAIVER.
- ENSURE THAT ALL SIGNATORIES SIGN THE FORM.

I, MICHAELLA VILLAMANTE, and a student of MALAYAN COLLEGES LAGUNA (hereinafter referred to as "MCL", do hereby voluntarily undergo on-the-job training at OOIS PHILIPPINES, INC., hereinafter referred to as the "Host Company", located at 3F, Insular Life Building, 6781 Ayala Avenue, Corner Paseo de Roxas Avenue, Makati City, 1225 Metro Manila, under the following terms and conditions:

- That the practicum training will commence on APRIL 27, 2026 and ends on JULY 21, 2026 and will have to complete a minimum of 480 hours required for the on-the-job training;
- That I shall observe proper decorum and act professionally at all times and abide by the Company's rules and regulations and comply with those imposed for the training program, otherwise, I shall be excluded from further participation;
- That in the course of my training program, I may have access to information which may be of confidential in nature and proprietary to the Company, for which I may be required to execute a confidentiality and non-disclosure agreement as a prerequisite to my participation in the training program;
- That the time I will spend on the training program in the completion of my on-the-job training requirements will not and should not be interpreted or construed as working hours and should be regarded as non-compensable. Provided that, the Company may, as a unilateral act of liberality or generosity on their part, provide me with meal, travel, transportation allowances, accommodations, etc.;
- That I fully understand that notwithstanding the allowances enumerated in the preceding section which I may receive, there exists no labor-management and/or employer/employee relationship between me and the Company where I will undergo my training;
- That I shall exercise due care and diligence in the tasks assigned to me and personally be made answerable for any and all liabilities for damage to property or injury to third person, which may be occasioned by my intentional or negligent acts during the course of my on-the-job training;
- That I shall likewise hold the Host Company and MCL free and harmless from any and all liability and responsibility for any sickness or injury to myself and third parties and damage to property which I may sustain and/or may occur at any time during the training program, including time spent in traveling to and from any and all premises and locations where I may be required to go to as part of my training program;
- That the Company reserves the right to discontinue my training on reasonable grounds upon written notice to MCL and myself. Additionally, in the event my training program is discontinued for reasons attributable only to myself, I may be made to reimburse the Host Company for any/all the allowances, stipends, etc., which I may have received from them during and prior to the termination of my training program;
- That in addition to my liability under section *g* and for the pre-termination of my training program provided for under section *h* hereof, I may be subjected further to disciplinary action in accordance with the school's student manual and/or be a ground for disqualification from graduation;

- HARD COPIES OF THIS FORM SHOULD BE COMPILED AS PART OF THE STUDENT'S PORTFOLIO.

|      |                                     |                 |                              |
|------|-------------------------------------|-----------------|------------------------------|
| DATE | April 27, 2026 to April 30, 2026    | AREA ASSIGNMENT | Business Analytics Technical |
| TASK | General IT and Soft Skills Training | SHIFT/TIME      | 9:00 am to 6:00 pm           |

During my first day of internship, the internship coordinator introduced us to the CODEX portal, where we accessed lecture videos about the platform, the program overview, and company rules. We also learned programming basics, focusing on PHP and how it integrates with HTML to create dynamic web pages. On the second day, the training focused on SQL using MSSQL, including RDMS concepts, SQL commands, and stored procedures for data management. Although I initially struggled to understand stored procedures, I was able to grasp the concept through self-paced practice. We were also introduced to CompTIA Cloud Essentials, which explained cloud computing principles and its benefits. On the third day, I studied Microsoft Excel, learning about formulas, pivot tables, charts, and VBA macros to automate tasks. On the fourth day, I explored Microsoft Visio for creating diagrams and learned professional workplace skills such as communication, proper attire, and email etiquette. Additionally, I gained knowledge about Enterprise Resource Planning (ERP) and its role in improving business efficiency. The training also covered the fundamentals of accounting, where I learned how businesses record and manage financial transactions using basic principles such as assets, liabilities, and equity. This helped me understand how accounting processes are integrated into ERP systems to support efficient business operations.

| TASK | Product Specific Training  | SHIFT/TIME      | 9:00 am to 6:00 pm           |

On the first day of the second week of my internship, the Phase 2 modules were introduced, focusing on product-specific training. The initial topics covered were data analytics, data visualization, and data warehousing. After learning these, I took the Phase 1 assessment, which I was unable to complete during the previous week due to a holiday. For the remaining hours, I watched a video demonstration on the use of Microsoft Power BI and data expressions. As part of the task, we were tasked with transforming a COVID-19 dataset and designing 3 dashboards named Invoice Report, Aging Report, and Customer Payment Status using the uploaded dataset and integrating columns and measures. On the second day, I received an email from my coordinator informing me that I had successfully passed the Phase 1 assessment. I then continued with the next set of topics, focused on SAP (Systems, Applications, and Products in Data Processing). This system is an enterprise resource planning (ERP) software designed as a centralized platform to support business operations. We were also provided with a module from openSAP titled "Getting Started With Data Science," which we were instructed to complete in a self-paced manner. I concluded the day by continuing my work on the dashboard. On Day 3, I continued learning through the openSAP modules, focusing on data preparation, and completed the final page of the dashboard task. On Day 4, I submitted the dashboard and data transformation task to the designated Drive. Afterwards, I continued the openSAP modules and completed the lesson about Cloudera, which is used for managing large-scale data across data centers and cloud platforms. On day 5, I reviewed the Phase 2 modules and took the Phase 2 assessment. I was informed that I failed the assessment and I need to retake the exam next week.

| TASK | Case Study                   | SHIFT/TIME      | 9:00 am to 6:00 pm           |

During the first day of the third week of my internship, I reviewed my modules again and retook the exam I had failed the previous week. Fortunately, I was able to pass the exam this time. On Day 2, I started reviewing the case study that we are required to present while waiting for HR to contact me. The case study focuses on a company that currently relies on multiple Excel files maintained by different personnel. Our task is to develop a strategy to solve the problem and create a dashboard that can monitor all aspects of the company's operation. On day 3, I identified that the first thing I had to do for the case study was store the files in a OneDrive folder to create a centralized location for pulling the data. After this, I connect Power BI to the folder to gather the files needed for data cleaning. Using Power Query, I removed empty columns, changed data types, removed blank rows, and promoted the first rows as headers. I encountered a challenge during this process because one table raised an error stating, "Cannot convert to a number." The only column in that table with a whole number data type was the CustomerKey. To troubleshoot the issue, I first removed the assigned data type and sorted the column in descending order. I later discovered that the Power BI Query Editor Preview only loads the first 1000 rows, which explained why a blank row appeared only after I applied filtering. After identifying the issue, I continued cleaning the data and drafted the possible relationships between each table. On Day 4, I established the relationships between the tables and created the initial report pages for the project. On day 5, I drafted initial designs and color palette for the report.

|------|------------------------------|-----------------|------------------------------|
| DATE | May 18, 2026 to May 22, 2026 | AREA ASSIGNMENT | Business Analytics Technical |
| TASK | Case Study/Work Immersion    | SHIFT/TIME      | 9:00 am to 6:00 pm           |

During the first day of the fourth week of my internship, I started designing the main dashboard, followed by the report pages for sales by territory and sales by reseller. I used DAX measures to compute the total number of products, orders, and sales amount using the SUM and DISTINCTCOUNT functions. To make the data easier to understand and analyze, I utilized bar charts, slicers, pie charts, KPI cards, and tables for data visualization. On Day 2, I received a message from the HR department of OGIS PH asking if I am able to attend a work immersion orientation meeting at 3:00 PM. I attended the meeting, where the HR representative discussed an overview of the company. Since we would be handling and receiving knowledge transfers regarding company data, we were instructed to strictly follow data privacy and confidentiality guidelines. On Day 3, we were asked to introduce ourselves to our supervisor in the morning. After that, our supervisor assigned us to our respective consultants, whom we would report to daily. I introduced myself once again, and we had a meeting scheduled at 4:00 PM. While waiting for the meeting, an email was sent containing an Excel file that needed to be filled out, along with several Google Forms related to the work immersion details. During the meeting, my consultant explained the task assigned to me, which was to create a mobile view for the logistics department of the client. There were 11 reports to be completed, varying across different countries. I then started browsing the layouts and designs of each report. On Day 4, I completed the first four reports, namely Departure to PH, Port Loading, Port of Destination, and Transit Time Compliance for China and Korea, including their tabular formats. On Day 5, I continued working on the remaining reports, which included Transit Time Compliance for Japan, Taiwan, Singapore, and the Middle East.

| DATE | May 25, 2026 - May 29, 2026 | AREA ASSIGNMENT | Business Analytics Technical |
| TASK | Work Immersion              | SHIFT/TIME      | 9:00 am - 6:00 pm            |

During the first day of the fifth week of my internship, I compiled all the errors I had encountered, along with the tasks that still needed to be completed and were unfamiliar to me. In the morning, my consultant asked me to join a call so she could guide me through resolving these issues. The first problem involved source errors appearing in two tables. I learned that these errors were caused by the query limit setting in Power BI. To resolve the issue, we changed the setting to "No Query Limit," which allowed all rows to load and display correctly in the tables. Another issue involved the bookmarks, where the "Passed" table continued to appear even when the "Failed" bookmark was selected. To fix this, we adjusted the visibility settings by modifying the eye icons in the Selection pane so that they corresponded correctly with their respective bookmarks (All, Failed, and Passed). Additionally, there were no layouts available in Version 1 of the Power BI file for the Active Deliveries Report. Because of this, my consultant instructed me to create my own design for Version 2 of the report. After completing the necessary fixes and designing the report layout, I submitted my output to my consultant for review. On the second day, my consultant informed me that additional slicers and text elements still needed to be added to the dashboard. She instructed me to open a sample dashboard she had previously designed and use it as a reference for the Logistics Department dashboard. After implementing the required changes and finalizing the design, I published the completed dashboard to the workspace. The third day of the week was observed as a holiday in celebration of Eid al-Adha. On the fourth day, my consultant assigned me a new task that involved creating an Excel file containing information, such as the Primary Metrics, Secondary Metrics, Link, and Filename from the given Power BI File. For the secondary metric reports, I documented the primary metrics they belonged to and recorded the name of each report. To obtain the source link from SharePoint, I accessed the Advanced Editor in Power Query and copied the source URL, which displayed the corresponding file name when opened. On the fifth day, I continued documenting the remaining 15 reports and finalized the Excel file after completing all the required information.

|------|-----------------------------|-----------------|------------------------------|
| DATE | June 1, 2026 - June 5, 2026 | AREA ASSIGNMENT | Business Analytics Technical |
| TASK | Work Immersion              | SHIFT/TIME      | 9:00 am - 6:00 pm            |

During the first day of the sixth week of my internship, my consultant asked me to refresh the Power BI because there could be new entries. When I refreshed it, an error appeared, which I raised, and she said she already fixed it, and I need to download the updated dashboard file. On Day 2, my consultant scheduled a meeting to discuss my next task, which involved creating a dashboard containing nine primary metrics and a table displaying their secondary metrics. The Excel file I previously created would serve as the reference for this task. After the meeting, I created a new Power BI file named "Latest Uploaded Data". I copied the primary and secondary metrics columns from Excel and imported them into a new table called "dim\_Metrics" in Power BI. I then copied the Advanced Editor codes of the 28 tables from the provided file and transferred them into my own dashboard. Each table had to be checked to ensure there were no null or zero values before removing unnecessary columns and retaining only the date column. On Day 3, I created the necessary DAX measures to display the Link, Filename, and Latest Upload Date from the table. For the Latest Upload Date, I used the MAX() function on the date column to retrieve the most recent available date. On Day 4, we had another meeting, where my consultant pointed out several metrics that I had overlooked or had not yet included in the dashboard. She also tasked me with researching conditional formatting so that if the latest uploaded date was before the current month, it would be flagged in red, and if it was within the current month, it would be displayed in green. Additionally, she also asked me to publish the file and send her the public link even before I had fully completed it. This would allow her to review the live report directly whenever necessary and provide feedback during the development process. On Day 5, it focuses mainly on finalizing the dashboard since most of the required processes had already been completed. I configured the background to match the conditional formatting applied to the Latest Uploaded Date. I also scheduled the report refresh to run every hour from 9:00 am to 4:00 pm to ensure the dashboard remained up to date.

|------|------------------------------|-----------------|------------------------------|
| DATE | June 8, 2026 - June 12, 2026 | AREA ASSIGNMENT | Business Analytics Technical |
| TASK | Work Immersion               | SHIFT/TIME      | 9:00 am - 6:00 pm            |

On the first day of the seventh week of my internship, I was assigned a new task that was still related to the dashboard project I had been working on. I needed to create another table for the primary metrics and add bookmarks for both the primary and secondary metrics. To begin, I created an Excel file to serve as a reference, containing the columns Primary, Metrics, Link, and Filename. Afterward, I created a new table in Power BI for the primary metrics and imported primary metric can have multiple sources. Unlike secondary metrics, DAX measures do not support the insertion of multiple links, making a separate source table necessary. On day 2, after finalizing my reference Excel file, I researched the use of bookmarks in Power BI. Through my research, I learned that bookmarks allow users to switch between different report views. For example, selecting the Primary button would display the primary metrics table, while selecting the Secondary button would display the secondary metrics table. To implement this functionality, I duplicated the existing table within the report and modified the visuals as needed for the primary metrics view. I then created bookmarks for both the primary and secondary views. Afterward, I added Primary and Secondary buttons and linked each button to its corresponding bookmark. On day 3, I communicated with my consultant regarding the display of the latest upload dates. Some of the required data came from a query rather than a link, which only functions correctly on their end. My consultant advised me to create the necessary DAX measure and comment it out temporarily before sending the Power BI file. She would then make the required adjustments on her side to ensure the measure worked properly. On Day 4, I finalized the dashboard and ensured the information for each metric was accurate and had no typographic errors. Day 5 was the national Independence Day.

On the first day of the 8th Week of my internship, my assigned task was to add an additional bookmark for AOP alongside the existing Primary and Secondary bookmarks. I was also tasked with replacing the Latest Upload column with FTD (Fiscal-to-Date), WTD (Week-to-Date), MTD (Month-to-Date), and YTD (Year-to-Date) values for each AOP metric. I began by identifying the source table of each AOP metric from the reference file. I reviewed the Advanced Editor code of each query to obtain the corresponding SharePoint source links and sheet names, which I documented in an Excel reference file. On Day 2, I copied the Advanced Editor code of each required table from the reference dashboard and integrated it into my own dashboard. Additionally, I created an AOP Sources table containing the Metrics, Link, and Filename columns to display them on the table later on. On Day 3, I developed DAX measures for each FTD, WTD, MTD, and YTD value. Afterward, I created three main DAX measures using SWITCH statements to dynamically retrieve and display the appropriate FTD/MTD/YTD values based on the selected metric. On Day 4, I created and configured bookmarks for each report page and updated the report visuals to display the necessary AOP-related columns. This ensured that users could easily navigate between report views and access the required information. On Day 5, I implemented conditional formatting to highlight blank FTD/MTD/YTD cells with a red background, making missing data easier to identify. I also configured the source links to be clickable for easier access to the original files. After completing all enhancements and validations, I finalized the dashboard and successfully published it to Power BI Service.

| TASK | Case Study / Work Immersion   | SHIFT/TIME      | 9:00 am - 6:00 pm            |

On the first day of the ninth week of my internship, I continued working on the same dashboard. My consultant instructed me to add a Sheet Name column to all Primary, Secondary, and AOP (Annual Operating Plan) reports. To accomplish this, I referred to the reference Power BI file through the Advanced Editor, identified the corresponding sheet names, and copied them into my Excel file. Afterward, I transferred the updated Excel table into the Power BI model and displayed the sheet names in each report. On the second day, my consultant arranged a consultation meeting regarding my case study. During the discussion, she provided several suggestions for improvement, particularly on the dashboard's color scheme, slicers, and key presentation points. She also advised me on how to effectively communicate the problem statement and proposed strategy. Following the consultation, I implemented the recommended enhancements and improved the dashboard accordingly. On the third day, I continued working on the client's dashboard and was assigned to validate the AOP values displayed in the reports. This involved inserting screenshots of the dashboard into an Excel validation file, then using the provided links to access the corresponding SharePoint files. I compared the values shown in the dashboard with the source data to verify their accuracy. On the fourth day, I continued performing the same validation process, ensuring that the displayed AOP values matched the source data and documenting any discrepancies that required further review. On the fifth day, I finalized the Excel validation file, conducted a final review to ensure all information was accurate, and submitted the completed file to my consultant for checking and approval.

On the first day of the tenth week of my internship, my consultant encountered an issue with my Power BI dashboard after editing several tables. While applying the changes across all the tables, the process took an unusually long time to complete. I volunteered to modify the tables on my end to help identify and resolve the issue. She instructed me to update all the tables by filtering the data to the latest available dates and removing duplicate records. This was done to verify whether the latest upload date displayed on the dashboard matched the most recent date contained in each table. To troubleshoot the problem, I loaded the tables individually to determine which specific table was causing the slow loading time. On the second day, I continued applying the required changes and investigating the performance issue. After testing each table, I discovered that one of them was loading an entire SharePoint folder instead of only the necessary files, causing the refresh process to take approximately three hours to complete. Once the modifications were finished, I published the updated dashboard so my consultant could download it and verify that the latest upload dates and visual formats were displayed correctly. On the third day, my consultant reviewed my Power BI dashboard and provided several enhancement suggestions. She first asked why the Filename column was also frozen together with the Primary and Metrics columns, even though she had only requested the first two columns to remain fixed. I explained that each metric could have multiple associated filenames, and including the Filename column in the row section is necessary to identify which file each metric belonged to during validation. She agreed with my explanation and allowed me to proceed with the remaining improvements. I then implemented her other recommendations, which included making the matrix visuals non-scrollable to simplify validation, changing the matrix grid borders from blue to dark gray for better readability, and rearranging the columns in the AOP matrix so that they followed the same column order as the Primary and Secondary matrices. On the fourth day, I continued implementing the remaining improvements based on my consultant's feedback. After completing the necessary modifications and verifying that the dashboard functioned as expected, I published the updated report to the Power BI Service for deployment and further review. On the fifth day, I prepared my PowerPoint presentation and presentation script for my internship case study in anticipation of my upcoming case study presentation later this month.

| TASK | Case Study / Work Immersion  | SHIFT/TIME      | 9:00 am - 6:00 pm            |

During the first day of the eleventh week of my internship, I continued developing the same Power BI dashboard. I added a new bookmark called "Calculation", where I was tasked with creating a table containing the Primary, Metrics, Filename, Link, Sheet Name, and the corresponding calculation formula for each metric based on my reference dashboard. I began by creating a DAX SWITCH measure to display the Calculation FTD (First-to-Date) values in the table. On the second day, I continued developing the DAX measures for Calculation WTD (Week-to-Date) and MTD (Month-to-Date). On the third day, I completed the Calculation YTD (Year-to-Date) DAX measure, finalizing all required calculation measures for the table. On the fourth day, my consultant advised me to learn how the Page Navigator and Bookmark Navigator work, as they provide a more efficient way to navigate reports compared to manually configuring bookmarks for every page. After understanding how these features function, I applied my learnings to my own report by organizing and grouping the bookmarks accordingly. On the fifth day, I displayed all the Calculation tables across the different report pages and submitted the updated dashboard to my consultant for review. Since the dashboard was already being used by the client, it was important to verify that all calculations and report elements were accurate before proceeding with the final publication.
